# Abstract

With the rapid development of microwave and millimetre-wave systems, the performance requirements for passive band-pass filters and diplexers, as essential parts in these systems, are steadily increasing. Both rectangular waveguide and substrateintegrated waveguide technologies help to satisfy various high-performance requirements. Rectangular waveguides offer the advantages of low loss and high power handling capabilities, while substrate-integrated waveguides have the advantages of low cost and easy integration into planar circuit technology. Besides, the miniaturisation of electronic devices is of great importance, especially for microwave or millimetre-wave systems whose volume is limited by system considerations. Hence, the two main aims of this thesis are firstly to develop efficient methods which can improve the design reliability and reduce the design cycle of such passive devices, and secondly to present novel structures of band-pass filters and diplexers whose dimensions are reduced.

In the first part of the thesis, a method based on the mode-matching technique is developed to rigorously and efficiently analyse the negative influence introduced by micromachining errors on the performance of band-pass H-plane iris filter. This analysis includes the effect on the centre frequency and 3 dB bandwidth caused by the round angles between waveguide walls and H-plane irises, or by the bevel angles on the Hplane irises. To remove these undesired influences, three approaches are proposed and verified with simulations performed with the finite-element method.

In the next part, efficient approximation approaches are investigated in the framework of the mode-matching method to analyse the characteristics of cylindrical posts placed in the cross-section of a rectangular waveguide or substrate-integrated waveguide. Compared with the H-plane irises in rectangular waveguides, cylindrical posts are more promising for realising band-pass rectangular waveguide filters, because the geometries are easier to manufacture and less prone to machining errors. Thus, a general design procedure for band-pass post filters in rectangular waveguides and substrateintegrated waveguides is developed and verified with finite-element simulations and measurements on prototypes. The tolerance analysis for the band-pass filters is also explored quickly and accurately with the developed method, while the influence of realistic material losses on the insertion loss of various structures, is also quantitatively analysed with a full-wave simulation solver.

Next, the characteristics of a shielded microstrip line for single-mode operation is investigated rigorously based on the mode-matching method. The research focuses on the influence of the metal enclosure dimensions on the fundamental mode, and the relationships between the cutoff frequency of the 2<sup>nd</sup>-order mode and the geometrical variables of the cross-section of the shielded transmission line. A similar method is then applied to an E-type folded substrate-integrated waveguide. The analysis demonstrates that the propagation characteristics for the first twenty modes in the E-type folded substrate-integrated waveguide and its corresponding equivalent rectangular waveguide are almost identical if the width of the middle metal vane in the E-type folded substrate-integrated waveguide is chosen reasonably. Exploiting this similarity property, a novel concept of band-pass post filter in E-type folded substrate-integrated waveguide technology is developed to reduce the band-pass filter dimension further, together with an efficient specific design procedure. The validity of the approach is verified via finite-element simulations and measurements on a fabricated prototype.

Finally, to reduce the sizes of common diplexers, four types of novel three-port junctions are proposed, including two improved Y-junctions in substrate-integrated waveguide technology, a double-layer junction in substrate-integrated waveguide technology, a Y-junction in T-type folded substrate-integrated waveguide technology, and a junction with stairs in T-type and E-type folded substrate-integrated waveguide technology. Exploiting the flexibility of the in-house developed mode-matching code or a commercial finite-element simulation solver, the characteristics for all presented junctions are shown to satisfy the constraints for optimum performance of diplexers when adjusting the relevant variables in the corresponding structures. Three types of these junctions are then utilised in realising diplexers whose performance is verified over the required operation bands with either numerical simulations or measurements on fabricated prototypes.

In summary, this thesis has introduced novel concepts and realisations of compact band-pass filters and diplexers in unfolded or folded substrate-integrated waveguide technology, as well as related structures. One of the crucial aspects emphasised throughout the research is the need for efficient and accurate modelling methods specifically tailored to support such developments. This has been demonstrated throughout the thesis with the combined use of powerful numerical methods and equivalent models based on symmetries or unfolded geometries.

# **Statement of Originality**

I certify that this work contains no material, which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

The author acknowledges that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

# Acknowledgments

First and foremost, I would like to express my sincere gratitude to my supervisors Assoc Prof Cheng-Chew Lim, Prof Christophe Fumeaux and Dr Thomas Kaufmann for their continuous guidance and support during my candidature. My principal supervisor, Assoc Prof Cheng-Chew Lim accepted me as a PhD candidate in 2012. His immense and professional knowledge, serious and responsible attitude, patient and enthusiastic supervision, and constructive suggestions provided significant help in advancing my research. From the third year of my candidature, I was honoured to be one of Prof Christophe Fumeaux's students, who is an expert in microwave and millimetrewave engineering and computational electromagnetics. He was always glad to share his extensive knowledge and abundant experimental experience, and welcomed scientific enquiries and discussions. My research work benefited a lot from his technical support, insightful advices, and meticulous feedback. Another co-supervisor whom I am genuinely indebted to is Dr Thomas Kaufmann. His deep theoretical knowledge, insightful comments, and encouragement were of great importance towards my research.

In addition to my supervisors, I would like to convey my gratitude to my friends and colleagues in the Adelaide Applied Electromagnetics Group in School of Electrical & Electronic Engineering at the University of Adelaide, Dr Ali Karami Horestani, Dr Zahra Shaterian, Dr Amir Ebrahimi, Mr Shengjian (Jammy) Chen, Dr Tiaoming (Echo) Niu, Mr Nghia Nguyen-Trong, Dr Withawat Withayachumnankul, Mr Chengjun Zou, Ms Wendy Suk Ling Lee, and Mr Sree Pinapati, to my advisor, Dr Yingbo Zhu, and to the professional staff, Mr Brandon F. Pullen, Mr Pavel Simcik, Mrs Rose-Marie Descalzi, and Mr David Bowler.

I would also like to express my heartfelt thanks to my best friends, Mr Ming Chen and Mr Qianwen Xia, for your warmest wishes, and your appearing in my life and keeping me company.

This thesis was made possible by an Australian Postgraduate Award Scholarship. I am sincerely indebted to the Department of Education and Training of Australian Government, which gave me the opportunity to undertake a PhD program at the University of Adelaide.

Last but not least, my endless love and appreciation goes to my parents who gave birth to me, raised and educated me with continuous love and patience, and were supporting and encouraging me infinitely.

> Cheng Zhao, March 2016, Adelaide

# **Thesis Conventions**

The following conventions have been adopted in this Thesis:

## Typesetting

This document was compiled using LATEX2e. Texmaker and TeXstudio were used as text editor interfaced to LATEX2e. Inkscape and Xcircuit were used to produce schematic diagrams and other drawings.

### Referencing

The Harvard style has been adopted for referencing.

### System of units

The units comply with the international system of units recommended in an Australian Standard: AS ISO 1000–1998 (Standards Australia Committee ME/71, Quantities, Units and Conversions 1998).

## Spelling

Australian English spelling conventions have been used, as defined in the Macquarie English Dictionary (A. Delbridge (Ed.), Macquarie Library, North Ryde, NSW, Australia, 2001).

	6006 (solid lines) at 10.5 GHz	103

5.1	Structure of a planar or quasi-planar transmission line for microwave,	
	millimetre-wave and optoelectronic applications	108
5.2	Cross-section of the shielded microstrip transmission line	121
5.3	Influence on the fundamental mode of varying (a) the width $a$ and (b)	
	the height $b$ of the shielding housing $\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$	124
5.4	Comparison of the fundamental mode's phase constant at 94 GHz be-	
	tween a microstrip line without housing and a shielded microstrip line .	125
5.5	Influence on the cutoff frequency of the $2^{nd}$ -order mode caused by the	
	geometry and the relative permittivity of the substrate	126
5.6	Structure of an E-type FSIW and its equivalent folded dielectric-loaded	
	rectangular waveguide	128
5.7	Relationship between the cutoff frequency of the first even mode in	
	FSIW and the length of the middle vane	130
5.8	Electric fields of the first even mode at $10 \text{ GHz}$ when the length <i>c</i> of the	
	middle vane is 4.74 mm, 9.68 mm, and 10.05 mm	130
5.9	Comparison of the even modes' phase constants of the folded rectangu-	
	lar waveguide with corresponding modes of the unfolded rectangular	
	waveguide when the length $c$ of the middle vane is 9.68 mm $\ldots \ldots$	131
5.10	Structures for posts placed in the cross-section of a folded and an un-	
	folded rectangular waveguide	132
5.11	Comparison of (a) $ S_{11} $ and (b) $ S_{21} $ between posts with different radii	
	r placed in the cross-section of a folded rectangular waveguide and the	
	equivalent unfolded rectangular waveguide	133
5.12	Structure of a 5-cavity Chebyshev band-pass post filter realised in: (a)	
	FSIW technology, (b) and its equivalent structure in SIW technology	135
5.13	Comparison of scattering parameters between the band-pass post FSIW	
	filter and its equivalent unfolded rectangular waveguide band-pass filter	136

5.14	Fabricated FSIW band-pass post filter (bottom and top substrates)	137
6.1	Structure of a common T-junction rectangular waveguide diplexer	141
6.2	Configuration of a diplexer modelled as a lossless three-port junction and two band-pass filters	142
6.3	Structures of (a) a Y-junction with two bends, and (b) its approximation steps including an H-plane step and a bifurcation step in a dielectric-loaded rectangular waveguide	147
6.4	Comparison between scattering parameters ( $ S_{11} $ , $ S_{22} $ , and $ S_{33} $ ) of Y- junction with bends calculated using the MMM and those of Y-junction without bends obtained using Ansys HFSS when (a) $L_b = 3$ mm, and (b) $L_b = 8$ mm	148
6.5	Structures of Y-junctions improved by (a) tuning the output branch angle $\varphi_1$ and (b) inserting vias into the junction	149
6.6	Scattering parameters obtained using the MMM for (a) improved Y-junction 1 and (b) improved Y-junction 2	150
6.7	Structures of (a) a double-layer three-port SIW junction and (b) its equivalent model	152
6.8	Elements used to form a double-layer three-port junction	153
6.9	Characteristics of the double-layer three-port junction when the width $g_s$ of the coupling slot is 0.1 mm, 0.45 mm, and 2.0 mm	154
6.10	Structure of Y-junction realised in: (a) FSIW technology, and (b) SIW technology	155
6.11	Cross-sections of equivalent solid-wall (a) folded waveguide and (b) un- folded waveguide	156
6.12	Comparison between the first twenty modes' phase constants of the folded rectangular waveguide and the corresponding modes of the unfolded rectangular waveguide	156
6.13	Scattering parameters of the folded and unfolded rectangular wave- guide Y-junction with $120^{\circ}$ angles	157
6.14	Influence on reflection coefficients caused by variations of (a) the width and (b) the thickness of the middle vane	158

6.15	Structures of a symmetric three-port junction formed with T-type and E-type FSIWs and its equivalent model 159
6.16	Scattering parameters of the three-port junction formed with T-type and E-type FSIWs
6.17	Structures of two diplexers with improved bent Y-junctions
6.18	Scattering parameters calculated using the MMM for (a) Filter 1 and (b) Filter 2
6.19	Comparison of scattering parameters obtained using the MMM (with- out considering losses and effect of transitions), the finite-element method Ansys HFSS and measurements for (a) Diplexer 1 and (b) Diplexer 2 168
6.20	Fabricated diplexers with improved Y-junctions
6.21	Structure of a diplexer realised in double-layer three-port junction 171
6.22	Scattering parameters calculated using the MMM for (a) Filter 1 and (b) Filter 2
6.23	Two common approaches to eliminate the unwanted bend discontinuity effect for transmission lines with (a) rounded corner (b) chamfered corner 174
6.24	Comparison of scattering parameters obtained using the MMM (with- out considering losses, effect of transitions, and SMA connectors), and Ansys HFSS (considering losses, effect of transitions, and SMA connectors)175
6.25	Structures of (a) the diplexer in FSIW technology and (b) the T-type FSIW-to-microstrip transimission
6.26	Comparison between scattering parameters simulated using Ansys HFSS for FSIW filters and that calculated using the MMM for the cor- responding unfolded filters
6.27	Scattering parameters for the diplexer in T-type and E-type FSIW technology obtained using Ansys HFSS

# **List of Tables**

2.1	Comparison of Numerical Methods	25
3.1	Dimensions of a $5^{th}$ -order Chebyshev band-pass iris filter (Units: mm) .	54
3.2	Dimensions of a 5 <sup>th</sup> -order Chebyshev band-pass iris filter with round	
	angles (Units: mm)	60
3.3	Dimensions of a $5^{th}$ -order Chebyshev band-pass iris filter with both	
	round angles and bevel angles (Units: mm)	64
4.1	Scattering parameters at 94 GHz (Units: dB)	81
4.2	Minimum number of steps $M$ to limit the errors of $ S_{21} $ in $\pm 0.1 \mathrm{dB}$ or	
	$\pm 0.05  dB$ (Units: dB)	85
4.3	Computation time and scattering parameters comparisons	85
4.4	Dimensions of a 5 <sup>th</sup> -order Chebyshev band-pass post filter in rectangu-	
	lar waveguide technology (Units: mm)	92
4.5	Dimensions of a 5 <sup>th</sup> -order Chebyshev band-pass via filter in SIW tech-	
	nology (Units: mm)	93
4.6	Filters designed with RT/duroid 6002 (Units: mm)	97
4.7	Filters designed with RT/duroid 6006 (Units: mm)	98
4.8	Insertion losses at 10.5 GHz introduced by different components of the	
	$N^{th}$ -order filters realised in RT/duroid 6002	101
4.9	Insertion losses at 10.5 GHz introduced by different components of the	
	$N^{th}$ -order filters realised in RT/duroid 6006	102
5.1	Parameters of a shielded microstrip transmission line	123
5.2	Sizes of an FSIW band-pass post filter (Units: mm)	134
6.1	Sizes of improved Y-junctions (Units: mm or degree)	151
6.2	Dimensions of the junction with stairs in T-type and E-type FSIW tech-	
	nology (Units: mm)	163
6.3	Synthesized parameters of the designed Chebyshev 3 <sup>rd</sup> -order band-pass	
	SIW via filters (Units: mm)	165

#### List of Tables

6.4	Dimensions of an SIW-to-microstrip transition and the distances be-	
	tween filters and junction ports (Units: mm)	167
6.5	Synthesized parameters of the designed Chebyshev 3 <sup>rd</sup> -order band-pass SIW via filters (Units: mm)	172
6.6	Dimensions of an SIW-to-microstrip transition, the side of the chamfered corner, and the distances between filters and junction ports (Units: mm)	172
6.7	Synthesized parameters of the designed Chebyshev 5 <sup>th</sup> -order band-pass via FSIW filters (Units: mm)	178
6.8	Dimensions of a T-type FSIW-to-microstrip transition, and the distances between filters and the junction ports (Units: mm)	180
