Thesis abstract

Terrace remnants of late Pleistocene fine-grained valley-fills, at present eroded by ephemeral traction-load streams, are reported from many semi-arid and arid parts of the world. While they present promising palaeo-environmental archives for recent geological times such as the Last Glacial Maximum (LGM) for which few other terrestrial depositional records exist, their poorly understood nature has limited their significance. This study examines the fine-grained valley-fill deposits from the Flinders Ranges in South Australia, here called Flinders Silts. It establishes the timing, mode and environmental controls of deposition as opposed to their advancing erosion under the current climate. A regional chronostratigraphy based on 124 numerical dates is discussed, of which 43 radiocarbon and 22 luminescence ages were obtained from 12 sections across three major catchments within the scope of this thesis. Regionally significant intervals of rapid aggradation, relative surface stability and erosion are established. Regional climatic controls are differentiated from intrinsic catchment- and site-specific effects on the system. Further, individual age proxies and age models are critically assessed in how far they reflect depositional events. The final aggradational interval bracketing the extended LGM is discussed in detail on a continuous layered to laminated stratigraphic sequence. The provenance question of the fine-grained sediments and the depositional environment of the Flinders Silts are further addressed by high-resolution particle-size analysis. In order to study the subtle variations within the fine-grained partially-aggregated material, an original parametric sediment-sizing approach is employed. Finally, a range of traditional and emerging analytical techniques are applied to improve our understanding of palaeo-environments promoting aggradation. In conclusion, arid intervals throughout the last glacial cycle resulted in significant quantities of proximal dust being deposited as loess mantles within the catchments of the Flinders Ranges, acting as a near-longitudinal dust trap in the centre of the late Pleistocene “dust bowl”. The fine-grained aeolian accessions were repeatedly eroded by low-frequency high-magnitude precipitation events and redistributed as loess-derived alluvium, congesting narrow gorges and raising the base level for tributaries. Locally, backflooding resulted in the aggradation of layered to laminated slackwater deposits, the most continuous recording at least 12 large and numerous smaller flood events between 24 ka and 18 ka. The synchronous termination of the Flinders Silts coincides with early Deglacial climatic amelioration. The re-establishment of a perennial plant cover stabilising both dune fields and slope mantles is discussed as a potential scenario that would have discontinued dust supply to the fluvial system, in turn promoting incision and erosion. The studied aeolian-fluvial interplay of loess and floods has large implications for our understanding of landscape evolution in semi-arid Australia.

Thesis declaration

This work contains no material which has been accepted for the award of any other degree or diploma in any university or other tertiary institution to me and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968. The author acknowledges that copyright of published works contained within this thesis (as listed below*) resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library catalogue, the Australasian Digital Theses Program (ADTP) and also through web search engines.

Co-author contribution declaration

For the following joint and multiple-authored papers, my co-authors kindly acknowledge their contributions as stated below and agree for a similar version of our paper to be included in this thesis:

1) **Loess and floods: high-resolution multi-proxy data of Last Glacial Maximum (LGM) slackwater deposition in the Flinders Ranges, semi-arid South Australia. *Quaternary Science Reviews*, (in submission)**

David Haberlah: conceptualisation of study, field work, laboratory work, paper writing

Martin A.J. Williams: PhD supervision, joint field work, editing

Galen Halverson: supervision of isotopic study, discussion of results

Tomas Hrstka: QEMSCAN® operation, discussion of results

Alan R. Butcher: QEMSCAN® supervision

Grant H. McTainsh: supervision of granulometric study

Steven M. Hill: PhD supervision, editing

Peter Glasby: GIS for figures 1 and 2, joint field work

2) **Quantifying particle aggregation in fluvial sediments. *Sedimentology*, (in revision)**

David Haberlah: conceptualisation of study, field work, laboratory work, paper writing

Grant H. McTainsh: project supervision, discussion of sample preparation, data analyses and results, editing

- 3) **“Of droughts and flooding rains”*: an alluvial loess record from central South Australia spanning the last glacial cycle.** In: Bishop, P. & Pillans, B. (eds) 2009, *Australian Landscapes. Geological Society, London, Special Publications, (in press)*

David Haberlah: conceptualisation of study, field work, AMS and OSL sample preparation (except stated otherwise), all age calculations, paper writing

Peter Glasby: contribution of 6 AMS and 2 OSL ages from section Cascades 1, and 6 AMS ages from section BRA07-SD included in tables 1 and 2, joint field work

Martin A.J. Williams: contribution of 3 OSL ages from section BRA-SG discussed in the text and included in tables 1 and 2, joint field work, editing

Steven M. Hill: PhD supervision, editing

Frances Williams: supervision of luminescence work, operation of OSL reader for all Adelaide samples (AdGI)

Edward J. Rhodes: operation of OSL reader for 6 samples from the Hookina catchment, discussion

Victor Gostin: PhD supervision, editing

Anthony O’Flanery: GIS for figure 1

Geraldine E. Jacobsen: supervision of AMS sample preparation and combustion at ANSTO (lab code OZK), editing

Acknowledgments

The teacher who is indeed wise does not bid you to enter the house of his wisdom but rather leads you to the threshold of your mind – Khalil Gibran

Ideas, support and supervision are best acknowledged in form of co-authorship on papers that arise from the collaboration. However, this would not rightfully acknowledge the important role that my supervisors and mentors played over the past three years guiding me through my PhD candidature. A role that goes beyond teaching me how to read geological records, conduct laboratory studies, write papers, apply for grants and present at conferences. It is the inspiration to think big questions while remaining aware of practical limitations, to enjoy what our field of science has to offer without overindulging. This important lesson required leading examples and a fine balance of patience and impatience to keep me on track “like the trains of old”.

In this sense, I have been blessed with experienced and inspiring supervisors. I would like to thank my co-supervisors Steven Hill, Victor Gostin, John Prescott, Frances Williams, Grant McTainsh, Galen Halverson, Andreas Schmidt-Mumm and Margaret Cargill for guiding me through crucial times of my candidature. In particular, my gratitude goes to my principle supervisor Martin Williams. I feel very privileged for the time and training he invested and shall always think of him in the German term as my “Doktorvater”.

Further, I would like to thank Peter Glasby for his good nature and patience. I am well aware that sharing a field area with me must have been at times testing. My sincere thanks for engaging in countless discussions and enduring numerous re-interpretations.

I would also like to thank my examiners Robert Wasson from Charles Darwin University and David Thomas from the University of Oxford for their prompt and thorough reviews of this thesis.

Finally, I am indebted to the University of Adelaide for awarding me the Endeavour International Postgraduate Research Scholarship (EIPRS) scholarship, which not only covered all fees, but provided me with generous means that allowed me to fully concentrate on my research.
