Your reference: DSR/BM/2021

My dear Professor Darrois,

I am delighted to learn from your letter of June 27th that you are in England, as I hope Madame Darrois is also. I hope it may be possible for me to see something of you now, and perhaps to collaborate unofficially with your problems. In any case, my wife and I would be delighted if you found it possible to spare a day to make us a visit here, to meet my little Department and have lunch with my family. If and when you find this possible I very much hope Madame Darrois may be able to accompany you.

I have read Hal^{ph}ken's notes on the dosage mortality curve, but I do not fully understand his purposes. I wonder if he knows the recommendations and treatment which we gave in the preface to Statistical Tables. In practice I imagine that procedure depends very much on the **relative** importance of speed and accuracy, and experienced people make the fit graphically with quite remarkable success. I take it that Hal^{ph}ken is thinking of supplying further aid at this stage.

Yours sincerely,
