

April 17, 1941

My dear Kendall,

Thanks for your letter which has only just reached me, owing to some irregularity. It is interesting that the inversion formula I have been using is a particular case of Lagrange's expansion and may be proved by that route; but for this purpose the route is a very circuitous one,^{so} that I am still curious as to whether any attention has been given to the very particular case I have in view. The three examples in Whittaker and Watson show no consciousness of this application. I shall try to look up Lagrange.

Yours sincerely,
