TABLE OF CONTENTS

ABSTRACT	10
CHAPTER 1- INTRODUCTION	12
CHAPTER 2: LITERATURE REVIEW.....	16
2.1 Method for literature review	16
2.2 Biological plausibility	17
2.3 Controlled Clinical studies.....	17
2.3.1 Effects on lung function	18
2.3.2 Effects on bronchial hyper-responsiveness	18
2.3.3 Effects on allergen responsiveness	19
2.3.4 Summary of clinical studies	20
2.4 Epidemiological studies conducted outdoors	21
2.4.1 General Population studies	21
2.4.1.1 Cohort studies.....	21
2.4.1.2 Studies including lung function measurements in the general population	22
2.4.1.3 Summary of outdoor studies in the general population.....	23
2.4.2 Asthmatic population.....	23
2.4.2.1 Studies including lung function in the asthmatic population	23
2.4.2.2 Hospital admissions.....	24
2.4.2.3 Panel studies	25
2.4.2.4 Summary of outdoor studies in the asthmatic population	27
2.5 Gas appliances exposure studies not measuring NO₂ levels	28
2.5.1 General population	28
2.5.2 Asthmatic population.....	29
2.5.2.1 Cross-sectional studies	29
2.5.2.2 Cohort studies	32
2.6 Studies measuring indoor NO₂.....	33
2.6.1 General population	33
2.6.1.1 Cross-sectional studies	33
2.6.1.2 Cohort studies	34
2.6.2 Asthmatic population.....	36
2.6.2.1 Case-control studies.....	37
2.6.2.2 Cohort studies	37
2.6.3 Summary of indoor studies: general population and asthmatics	38
2.7 Objective lung measurements and indoor NO₂ exposure.....	40
2.8 NO₂ exposure measurements - what are the important issues of exposure ascertainment in epidemiological NO₂ studies.....	42

2.9 Conclusion from literature review	46
2.10 Aim, hypotheses and objectives of the proposed study	51
CHAPTER 3 - PILOT STUDY.....	55
3.1 Introduction	55
3.2 Aim and objectives of the pilot study.....	56
Objective one: Environmental survey	56
Objective two: Protocol development for classroom exposure measurements of NO ₂	56
3.3 Methods used in pilot study	57
3.3.1 Environmental survey.....	57
3.3.2 Passive diffusion badge monitoring	58
3.3.2.1 Chemical analysis	58
3.3.2.1 Sampling protocol.....	60
3.3.3 Chemiluminescence monitoring	61
3.3.4 Statistical analysis.....	61
3.4 Results.....	64
3.4.1 Objective one: Environmental Survey.....	64
3.4.2 Objective two: NO ₂ methodology	65
3.4.2.1 Descriptive NO ₂ exposure	65
3.4.2.2 Comparison of one hourly maximum NO ₂ levels with six hourly maximum NO ₂ classroom levels.	67
3.4.2.3 Agreement between and repeatability of NO ₂ measurements	67
Discussion	71
CHAPTER 4 - METHODOLOGY FOR MAIN STUDY	75
4.1 School selection	75
4.2 Randomisation	76
4.3 Intervention	77
4.4 Recruitment and maintenance of the study	79
4.4.1 Personnel	79
4.4.2 Asthma survey	80
4.4.3 Eligibility and consent.....	80
4.5 Demographic and clinical factors.....	83
4.6 Study overview.....	85
4.7 Exposure measurements	86
4.7.1 Nitrogen dioxide assessment in classrooms	86
4.7.2 Nitrogen dioxide exposure assessment in children's homes	88

4.7.3 Environmental tobacco smoke.....	89
4.8 Outcome Measurements.....	89
4.8.1 Symptom diaries.....	89
4.8.2 Lung measurements.....	90
4.8.2.1 Personnel	90
4.8.2.2 Information For Parents.....	91
4.8.2.3 Methods Of Measurement	91
4.9 Statistical analyses	97
4.9.1 Adjustment for clustering	97
4.9.2 Non clustered (Nn) sample size calculation for asthma symptom rates....	98
Sample size: 318.....	99
4.9.3 Sample size calculation for objective lung measurements	100
4.9.4 Estimation of source population and asthmatic children.....	100
4.9.5 Analysis of lung function results	101
4.9.6 Analysis of bronchial hyper-responsiveness	102
4.9.6.1 Calculation of PD20FEV ₁	102
4.9.6.2 Calculation of DRS.....	103
4.9.7 Statistical analyses of diaries	104

CHAPTER 5 - RESULTS FROM RANDOMISED CONTROLLED TRIAL ..107

5.1 Randomisation Outcome.....	107
5.1.1 Participation.....	107
5.1.2 Distribution of baseline variables	111
5.1.3 Baseline severity of asthma	111
5.1.4 Discussion of baseline characteristics	115
5.2 Results from Nitrogen dioxide measurements	117
5.2.1 NO ₂ concentration in classroom	117
5.2.1.1 All NO ₂ measurement badges.....	117
5.2.1.2. Mean NO ₂ levels at classroom level for participating children.....	119
5.2.1.3 Classroom measurements of NO ₂ compared to WHO guidelines	121
5.2.2 Outdoor levels of NO ₂	123
5.2.3 NO ₂ results from children's homes	123
5.2.4 Conclusion and implications from NO ₂ measurements	128
5.3 Results for objective lung measurements	130
5.3.1 Participation in lung measurements.....	130
5.3.2 Spirometry results.....	132
5.3.2.1 A priori sample	132
5.3.2.2 Extended sample.....	132
5.3.2.3 combined sample	133
5.3.2.4 Reversibility.....	135
5.3.3 Bronchial hyper-responsiveness results.....	136
5.3.3.1 A priori sample	136
5.3.3.2 Extended group of children and the combined group of children	136
5.3.3.3 Severity of BHR	137
5.3.4 Summary of objective lung measurements.....	137

5.4 Results from symptom diaries	141
5.4.1 Participation in symptom diaries	141
5.4.2 Distribution of symptom presence/absence during the study period.....	142
5.4.2.1 A priori sample	142
5.4.2.2 Extended sample.....	144
5.4.2.3 Combined sample	144
5.4.3 Asthma symptom rates	147
5.4.3.1 A priori sample	147
5.4.3.2 Extended sample.....	149
5.4.3.3 Combined sample	149
5.4.4 Summary of symptom result.....	153
CHAPTER 6 – DISCUSSION AND CONCLUSION.....	157
6.1 Introduction	157
6.2 Randomisation	158
6.3 Intervention.....	159
6.4 Lung function results.....	160
6.5 Bronchial responsiveness	161
6.6 Symptoms results.....	163
6.7 Bias	165
6.8 Limitations of the study	165
6.9 Extending the findings to other sources of NO₂.....	166
6.10 Conclusion	168
Future studies.....	170
BIBLIOGRAPHY	171

Abstract

A Randomised Controlled Trial Investigating The Effects Of Nitrogen Dioxide On Asthmatic Children In Primary School Classrooms

(356 words)

The aim of this study was to determine the effects of a randomised controlled trial of unflued gas heater replacement on asthma in children.

18 schools (134 classrooms) using unflued gas heaters in winter were randomly allocated an intervention of heater replacement with either flued gas heaters (4), or electric heating (4), or remained unflued (10). The main eligibility criteria were (i) doctor diagnosed asthma with (ii) no unflued gas sources at home (a priori sample). The sample was extended to asthmatic children with home gas cooking (extended sample). Participants kept a daily diary of symptoms for 12 weeks in order to establish symptom rates in the intervention and control groups. Lung function and bronchial hyper-responsiveness (BHR) tests were performed at the beginning and end of the study period. Indoor NO₂ was monitored in classrooms and homes during the study period.

Mean NO₂ exposure was significantly lower in intervention schools (15. 5 ppb SD:6.6) compared to control schools (47.0 ppb SD:26.8). Mean kitchen NO₂ levels were significantly lower in the a priori sample compared to the extended sample (14.3 ppb CI:10.3-18.3 vs 28.7 ppb CI: 24.1-33.3; p<0.001).

In the a priori sample there were 45 and 73 children in the intervention and control groups respectively, and 43 in each group in the extended sample.

In the a priori sample, difficulty breathing (RR: 0.32; CI: 0.14-0.69), chest tightness (RR: 0.45; CI: 0.25-0.81), and asthma attack (RR: 0.39; CI: 0.17-0.93) rates were significantly decreased in the intervention group compared to the control group. In the extended group, symptom rates were not significantly different. Mean %predicted FEV₁% and BHR were similar between intervention and control groups.

Significantly reduced NO₂ levels in classrooms were accompanied by more than a 50% reduction in some asthmatic symptoms in the intervention a priori group. This was not found in the extended sample, likely due to misclassification of exposure associated with home exposure from gas cooking.

Nitrogen dioxide is associated with increased asthma symptoms in children, and replacement of unflued gas heating in schools should become a public health priority for school authorities. Furthermore, the result may implicate unflued gas appliances in environments other than classrooms.
